MULTI-FUNCTION AUTO-CONTROL VALVE

- ▶ Controller is fixed directly and designed of non-controller conduit. It reduces the damage of the controller conduit while transporting the equipment.
- ▶ Controller is designed to be quickly screw fastened, enabling fast and easy installation.
- ▶ The valve body can match with all types of controller without technical conversion, and all kinds of control valves can be formed.
- ▶ Cylinder design is adopted for the valve body structure, making the valve applicable to low and high pressure in both vertical and horizontal positions.
- ▶ Straight flow path is designed inside valve body. The large flow can reduce the malfunctions caused by impure water and effectively decrease turbulence and related bad effects.
- ▶ The valve body is shaped and formed as whole. Small volume, lightweight, and easy installation. Simple and elegant appearance.
- ▶ Professional manufacturers, best quality, and reasonable price.

▶ Patent Number : 135517

1. Applied conditions: Fluid & Air

2. Applied temperature: -15° ~ 80°C

3. Connection ends: Available for all international standards

4. Materials of valve body: Cast Iron, Ductile Iron, Bronze & Stainless Steel

The valve body of main valve becomes functional by an inlet-guiding hole. This hole transfers pressure to pressure chamber. When enough pressure accumulates in the pressure chamber, it generates pushing force that makes the piston close to valve seat and generates the closing motion. There is another outlet guiding hole inside the pressure chamber. When the hole is open, pressure in pressure chamber dissipates and valve gate is pushed open by incoming water pressure.

FLOAT VALVE

Float valve uses a sub-valve (float valve switch) to control the main valve. When the water level elevates to the full water level set by sub-valve (float valve switch), the sub-valve (float valve switch) closes and the back pressure chamber inside the main valve accumulates pressure rapidly, which reversely pushes the piston valve to close. By this mechanism, the float valve can thus control the water level. In order to save space inside the pool and for easy maintenance, it is recommended to install the float valve outside the pool.

【Float valve closed state】

【Float valve open state】

⊙ At full water level, pressure accumulates in the pressure chamber and pushes the gate reversibly.

⊙ At low water level, pressure in pressure chamber dissipates, and water pressure inside the pipe pushes the gate open.

- ▶ The working pressure should be greater than 0.3 kgf/cm^2 and gate fully open with 1.5 kgf/cm^2 , please check the pressure before installation.
- ▶ Please remove impurities or metal dusts inside the pipe thoroughly. If possible, please add filter to prevent pipe blocking.
- ▶ Vertical and horizontal installation is acceptable. Avoid upside-down installation under insufficient flow.
- ▶ Float ball size is 4", and the connection end is 1/2" PT Thread (Max. Pressure 10 kgf/cm^2).

SOLENOID CONTROL VALVE

► Solenoid control valve is a kind of isolation valve, which can substitute traditional gate valves, ball valves and butterfly valves. The gate functioning is easily controlled by electrical power. The valve can be installed in fire control facility, water supply, or distant location where it's difficult to control the gate opening. The controller is directly fixed and can be easily installed on piping site. Interchangeable between manual and solenoid control.

Ball valve must be closed when the set is controlled by solenoid switch.

※ Specification of Solenoid Control Switch

- Working Voltage : DC12V, DC24V, AC110V/220V, 50/60Hz
- Electrifying Time Range : 1 year continuously for 10,000 hours
- Allowable Voltage Range : $\pm 10\%$
- Applied Temperature : $-15 \sim 80^{\circ}\text{C}$
- Durability : 500,000 Cycles
- Applied Pressure Range : $0.3 \sim 10 \text{ kgf/cm}^2$
- Generally NC type (open when switch on), special order is needed for NO type (close when switch off) .

- The working pressure should be greater than 0.3 kgf/cm^2 and gate fully open with 1.5 kgf/cm^2 , please check the pressure before installation.
- Please remove impurities or metal dusts inside the pipe thoroughly. If possible, please add filter to prevent pipe blocking.
- Avoid upside-down installation under insufficient flow. (Valve's inlet should face up when it is installed)

PRESSURE REDUCING VALVE

- ▶ Pressure reducing valve can prevent pipeline breakage due to high pressure.
- ▶ Pressure reducing valve is installed in water supply pipeline and maintains the setting outlet pressure in main valve, regardless of the different inlet pressure.
- ▶ Pressure reducing valve can be installed in water supply, air conditioning and fire control systems to maintain the setting outlet pressure.

The pressure reducing valve uses a sub-valve (pressure reducing pilot valve) to control the main valve. When the outlet pressure reaches the setting range of pressure reducing pilot valve, the pilot valve will automatically sense the outlet pressure and adjust the pressure of the back pressure chamber in the main valve, so the valve gate can be opened and consequently maintains the outlet pressure.

- ▶ Pressure Adjusting Range : 1 ~ 7 kgf/cm²
(1 kgf/cm² = 14.2 psi) 4 ~ 12 kgf/cm²

◎Special order can be arranged for higher pressure adjustment range.

- ▶ The pressure meter on the pilot valve shows the outlet pressure. When the outlet opens, the value of the pressure meter is lower.
- ▶ When the outlet is used for large flow and the gate generates quick-close motion, the pilot valve will slowly respond to the main valve to close the gate. Under this situation, the outlet pressure gets a little higher, and a tiny pressure reducing valve can be added.

PRESSURE SUSTAINING VALVE

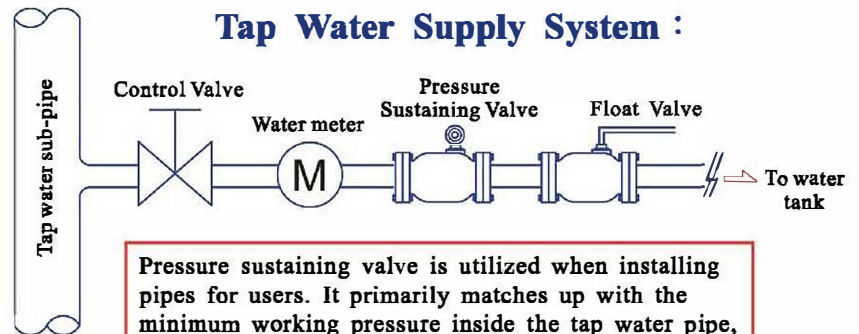

- ▶ Pressure sustaining valve is utilized when installing pipes for users. It primarily matches up with the minimum working pressure inside the tap water pipe, balancing up-stream and down-stream pressure during normalcy and emergency, and maintains constant pressure inside the pipe.
- ▶ Pressure sustaining valve can sustain the maximum working pressure inside the pipe when installed in water supply areas.
- ▶ Pressure adjusting range : $0.3 \sim 4 \text{ kgf/cm}^2$
($1 \text{ kgf/cm}^2 = 14.2 \text{ psi}$) $3 \sim 10 \text{ kgf/cm}^2$

- ▶ The working pressure should be greater than 0.3 kgf/cm^2 and gate fully open with 1.5 kgf/cm^2 , please check the pressure before installation.

Tap Water Supply System :

Pressure sustaining valve is utilized when installing pipes for users. It primarily matches up with the minimum working pressure inside the tap water pipe, balancing up-stream and down-stream pressure during normalcy and emergency, and maintains constant pressure inside the pipe.

Applied condition of Direct-activated Pressure Reducing Valve :

- ▶ Installing pressure reducing valve directly in sub-pipe can reduce fluid pressure inside the pipe.
- ▶ Installing a filter in the inlet of pressure reducing valve can prevent block of valve gate caused by impurities and limescale.
- ▶ Installing pressure relief valve downstream pressure reducing valve can protect the system.
- ▶ While using screws to connect pressure reducing valve, joints should be installed in the inlet and outlet to make maintenance easy.

Pressure Setting and Flow Rate of Direct-activated Pressure Reducing Valve :

- ▶ Direct-activated pressure reducing valve directly opens and closes the valve gate by the outlet pressure. When outlet pressure is under setting pressure, valve gate automatically opens. To make valve gate fully open, adjustable pressure range and setting pressure are relative points.
- ▶ $A : \text{Pressure drop needed for fully-opened valve gate} = \frac{B}{4}$, $B = \text{Adjustable Pressure Range}$
Maximum-Minimum
- $B : \text{Adjustable Pressure Range} (= \text{Maximum Minimum Adjustable Pressure Range})$
- $C : \text{Setting Pressure of Outlet}$
- $P : \text{Pressure of fully-opened outlet valve gate, } P = C - A$

Example :

Pressure drop needed for fully-opened valve gate for adjusting pressure range 3~9 kgf/cm² of direct-activated pressure reducing valve. $A = \frac{B}{4} = \frac{9-3}{4} = 1.5 \text{ kgf/cm}^2$

If the setting pressure of outlet is 6 kgf/cm², pressure of fully-opened valve gate will be

$P = 6 - 1.5 = 4.5 \text{ kgf/cm}^2$ (Outlet pressure should go down under 4.5 kgf/cm² to make valve gate fully open)

Flow Chart of Direct-activated Pressure Reducing Valve

LOW PRESSURE TYPE DIRECT-ACTIVATED PRESSURE REDUCING VALVE (Stainless Steel 316)

- ▶ Valve Body is made by Stainless Steel #316, suitable for fluid, air and oil.
- ▶ Larger diaphragm is more sensitive to pressure.

Thread / Flange Type

©Thread type does not have Part No. 10.

- ▶ Pressure Adjusting Range : 0.2 ~ 1.5 kgf/cm²

DIRECT-ACTIVATED PRESSURE REDUCING VALVE

- ▶ The gate is designed for opening status, which will not influence the water supply function under unstable inlet pressure condition.
- ▶ When the outlet pressure responds directly to the pressure control chamber and adjusts the setting pressure, it responds quickly and adjusts the pressure accurately.

- ▶ Pressure Adjusting Range : 1~3 kgf/cm²
2~5 kgf/cm²
4~9 kgf/cm²

(special order is needed for other range)

- ▶ Valve Body Testing Pressure : 21 kgf/cm²
- ▶ Maximum Applied Pressure : 12 kgf/cm²
- ▶ Pressure needed from fully-closed gate to fully-opened gate : 1 kgf/cm² (1 kgf/cm²=14.2 psi)
- ▶ Applied Temperature : -15~80°C
- ▶ Applied Condition : Fluid & Air

Open state

ON

When the handle is rotated upward, pressure reducing valve set becomes pressure reducing open state.

Bypass open state

PASS

When the handle is rotated to horizontal position, pressure reducing valve set becomes bypass open state.

Closed state

OFF

When the handle is rotated downward, pressure reducing valve set becomes pressure reducing closed state.

DIRECT-ACTIVATED PRESSURE SUSTAINING / BACK PRESSURE VALVE

- ▶ The whole set is made by stainless steel #316, and it is suitable for the fluid of pure water, acid & alkaline fluid, steam or air. Pressure needed from fully-closed gate to fully-opened gate: 1.5 kgf/cm².
- ▶ Back pressure valve can maintain required pressure.
- ▶ Design of piston and diaphragm improves the inability of sustaining pressure and leakage.
- ▶ Back pressure chamber controls the valve gate and let gate respond, quickly and adjust pressure accurately.

- ▶ Pressure Adjusting Range : 1~5 kgf/cm²
(1 kgf/cm²=14.2 psi) 4~10 kgf/cm²
- ▶ Applied Temperature : -15~100°C
100~180°C (For steam)
- ▶ Valve Body Testing Pressure : 35 kgf/cm²
- ▶ Maximum Applied Pressure : 25kgf/cm²
- ▶ Pressure gauge indicates the sustaining pressure.

► **Back Pressure (Sustaining) Valve:**

It's installed in branch pipe to maintain the stable pressure of fluid inside pipe. When pressure exceeds setting valve, it will automatically release over high pressure.

► **Pressure Relief Valve:**

It's installed in branch pipe. When pressure exceeds setting valve, valve gate will quickly and fully open to release pressure. As pipeline pressure goes down to certain level, valve gate will close slowly.

► **Applied condition of Back Pressure Valve:**

Example 1

© In different pressure systems of processing pipelines, installing back pressure valve can maintain required pressure of the systems and ensure safe uses of equipments after pressure reducing valve reduces pressure.

Example 2-

© Installing back pressure valve enables largest flow application and also stabilize pipeline pressure.

Gate Full Open, Normal atmospheric temperature

Installing air release valve at the pipe line where gather easily the air.

DIAPHRAGM TYPE WATER HAMMER ARRESTER

The occurrence and prevention of water hammer effect:

When the fluid flows in the pipe, if the gate closes suddenly and stops the flow, the kinetic energy will be changed into elastic resilience and create a serial positive and negative pressure wave vibrating back and forth in the pipe until the energy is lost by friction. Especially when the pump stops, the fluid still flows by inertia and gravity also causes the fluid to flow back, and these two forces will cause the positive and negative pressure waves. The friction caused by the two waves will make the pipe vibrate and create noise. Hence, the life of the pump and the piping accessories will be affected and, at the same time, cause the uncomfortable noise under such situation, to set up one or more sets of water hammer arrester will improve the situation. Our company make use of the airbag principle to design water hammer arresters which will reduce the vibration by pressing air when the in-pipe pressure transfers to air chamber.

The features of water hammer arresters :

- ▶ The airbag adopts the ball-pressing-type design, which without friction, less function progresses, prompt and quick response and has obvious result. In addition, the life of the arrester will be increased several times.
- ▶ The arrester will absorb water hammer directly and has the functions of water hammer prevention and absorption.
- ▶ Special design of the air diaphragm rubber will not release pressure and its life won't be affected by the bad water quality.
- ▶ To prevent the air leakage, the pressed air chamber is covered by permeating prevention rubber.
- ▶ The design of structure is excellent and easy to maintain.

The fluid pressure of the water hammer effect.

The water hammer effect caused by closing the valve should be added at the largest water head in the pipe to calculate the height of the pressure water head and fluid pressure .

Vensano's formula :

$$Z_o = \frac{2LV_o}{gT}$$

H_o = the pressure water head before closing the valve

V_o = the flow speed before closing the valve

T = the time needed to close the valve

L = the pipe length between the inlet and outlet of free water surface

Z_o = the largest pressure water head increased by water hammer effect

H = full pressure water head after adding water hammer at the end of the pipe

Remark: the transferring speed of in-pipe pressure and acceleration
(about 1000 m / second)

Example : Assume $V_o = 5$ m/ sec, $H_o = 72$ m, $L = 210$ m, if the it takes 3 seconds to close the valve, then, what is the pressure of water hammer?

$$Z_o = \frac{2LV_o}{gT} = \frac{2 \times 210 \times 5}{9.81 \times 3} = \frac{2100}{29.43} = 71.35 \text{ m}$$

The full pressure water head including water hammer is : $H = Z_o + H_o = 71.35 + 72 = 143.35$ m

Assume the pressure water head 10 m = 1 kgf/cm²

Then, The fluid pressure including water hammer is : $143.35 / 10 = 14.335$ kgf/cm²

L STYLE WATER HAMMER ARRESTER

Patent Number : 131907

- ▶ The flow-directing mechanism in the valve can guide the flow and stabilize pressure.
- ▶ In the corner of pipe, the water hammer is the most obvious. The design is for meeting the requirement and set the arrester at the corner directly. This design not only saves the space and is easy to set up, but also can replace the traditional crooked head to reduce the cost of setting up.
- ▶ L style absorbs water hammer effect in two ways and brings excellent result.

- ▶ **Applied Conditions: Fluid**
- ▶ **Applied Temperature: -15 ~ 80°C**
- ▶ **Diaphragm Material: NBR & Viton**
- ▶ **Normal air chamber pressure: 2.5 kgf/cm²**
- ▶ **The test pressure of valve body:**
Cast Iron & Bronze : 21 kgf/cm²
Stainless Steel 304 & 316 : 30 kgf/cm²
- ▶ **Maximum Applied pressure:**
Cast Iron & Bronze : 12 kgf/cm²
Stainless Steel 304 & 316 : 20 kgf/cm²
(1 kgf/cm²=14.2psi)

Flange Type (Material: Cast Iron or Stainless 304 or 316)

THE INSTALLATION CONDITIONS OF L STYLE WATER HAMMER ARRESTER

When pump shuts off, pressure decreases instantly and forms unstable gap of positive and negative pressure that causes water hammer effect and creates noise and pipe vibration. To set up water hammer arrester at the pipe corner upside of the pump (shown as the figure) can prevent the water hammer effect and protect the machine.

► Remark :

When lift is longer than 50m and pressure is above 5 kgf/cm², we suggest to set up arresters each at the downside of the long pipe and the upside corner of the check valve.

Silent Check valve

It's easy to cause water hammer effect when the gate closes fast. To set up arrester at the first corner away from the fast-shut-down valve can absorb and prevent the water hammer effect directly and eliminate the noise.

When the fluid flows through the serial corner, the change of flow speed and direction and friction effect will cause unstable pressure wave, which will lead to vibration and noise. To set up arrester and silent check valve can eliminate the pressure wave.

Remark

- The pressure meter on the valve shows the air chamber pressure before piping and will show the pipeline pressure after piping.
- To leave a 10 cm opening between valve and wall for easy to maintain.
- Considering the high-pressure situation, cast iron or stainless steel valve body is suggested for the valve which diameter is larger than 2".
- When lift is longer than 50m and pressure is above 5 kgf/cm², we suggest to set up arrester each at the downside of the long pipe and the corner upside of the check valve.
- Before installation, make sure the pressure of water hammer arrester air chamber is lower than pipe pressure.
- When the pressure of the air chamber of the water hammer arrester is maintained at the 30% ~ 50% of pipe pressure, the arrester will have the best water-hammer-preventing result.
- If the water pressure in the pipe is lower or the air pressure of the arrester air chamber is lower, both can be corrected by pumped into air or release air from the air-pumping hole at the top of the arrester.
- When the outlet is under open pressure like float valve, bathroom equipment and faucet, input pressure 1 ~ 1.3 kgf/cm² is preferred.

I STYLE WATER HAMMER ARRESTER

FULL OPEN STYLE SILENT CHECK VALVE

The silent check valve is applied on lift pipe or fluid pipe with pressure. The valve gate, with restoring force, will be closed at suitable speed when pump is shut down to separate the collision and noise between the inertia fluid (positive pressure) and the back flow (negative pressure) caused by power off.

The silent check valve plays an important role on piping, especially applied on the outlet of the pump. The silent check valve applied on the outlet of the pump should be selected carefully, and it must be able to resist the highest pressure, the largest water hammer effect and the biggest fluid impact. If the silent check valve is not good enough, when silent check valve is damaged, it will cause the fluid flowing back and losing pressure or, more serious, the damaged parts will fall on the blades and damage the pump seriously and, hence, loses more money.

To avoid the defects mentioned above, our company manufacture a more practical and economical model, called

" FULL OPEN STYLE SILENT CHECK VALVE"

Features:

- ▶ The design of the valve is full flow lift type and water flow does not directly push the valve gate. Hence, the valve can work for a long time and have huge flow rate.
- ▶ The design of plug is hang type and automatically locating. It can adjust the close position of the plug no matter high or low pressure.
- ▶ The design of sealing is "U" and it is suitable for high and/or low pressure condition. And the tightness of the valve gate is best.
- ▶ The design of plug is semi-round and can resist higher pressure.
- ▶ When the pressure is high, plug and seat work together to prevent the sealing from being pushed by the high pressure to lengthen the longevity of sealing.
- ▶ Test pressure : Stainless Steel : 35 kgf/cm² ;
Ductile Iron : 35 kgf/cm² ; Cast Iron : 21 kgf/cm²
- ▶ Maximum applied pressure : Stainless Steel : 20 kgf/cm² ;
Ductile Iron : 20 kgf/cm² ; Cast Iron : 16 kgf/cm²
- ▶ Applied temperature : -15~80°C
- ▶ Vertical and horizontal installation is acceptable.

Spring	Stainless Steel	Stainless Steel 304
Pin	Stainless Steel	Stainless Steel 304
Sealing retainer	Brass	Stainless Steel 304
Sealing	NBR	NBR

©The bypass valve set won't be attached if the diameter is larger than 6 inches.

IMPROVEMENT OF THE FLOW OF FULL OPEN STYLE SILENT CHECK VALVE

The Improvement of Full Open Style Silent Check Valve on Flow Rate

The full open style silent check valve adapts the lift open style plug and the plug has hidden bypass design, which will bring the smallest flow resistance inside the valve body. When fluid flow through the valve, and hence, will reduce the loss of pump running effect and improve the power efficiency. Since that, the defects of traditional silent check valve, e.g. Many turning points, large resistance, not smooth flow way and fluid impact the valve directly and shorten the valve life, have been improved.

Full Open Style Silent Check Valve

Traditional Silent Check Valve

Full Open Style Silent Check Valve Flow Chart

The comparison of CV values between Full Open Style Silent Check Valve and Traditional Silent Valve

$$CV = \frac{Q}{\sqrt{\Delta P/S}}$$

Q=Rate of flow (GPM)

P=Pressure drop across valve (p.s.i)

S=Fluid density
(1 Gallon=3.785 Liter)

PUMP CONTROL VALVE

- ▶ Perfectly prevents water hammer effect.
- ▶ Pump Control Valve = Pump's Variable Drive + Check Valve + Water Hammer Arrester. No need to use "Inverter Duty Motor" and save costs.
- ▶ Speed of valve opening and closing are adjustable upon request.
- ▶ Simple installation and outstanding function.
- ▶ Piston design structure resists high pressure and makes maintenance & replacement easy.
- ▶ It is convenient to clean the impurities inside valve gate from the cleaning plug.

Function of Pump Control Valve

FOOT VALVE (With Clean Lever)

Foot valve is for use as inlet of suction pipe. A modified check valve that has a screen on the suction end to prevent debris from entering the pump or pipe. It protects against loss of prime, aids in priming the pump and protects the pump from large debris. (Only Vertical installation)

- ▶ Fluid : Water
- ▶ Max Working Pressure :
Cast Iron : 12 kg/cm²
Ductile Iron & Stainless Steel : 20 kg/cm²

Float Valve Switch

- All SS4 stainless steel construction.
 - Rotational float ball.
 - Pressure range up to 10 Bar, 20 Bar (Open Request)
 - Inlet/outlet DN 154 (mm)
 - Working temperature up to 80°C.
 - Suitable for high flow.
 - Connections in Thread or Flanged.
- See page 304 (PDF) 305(P)

AIR RELEASE VALVE FOR FIRE FIGHTING

Air release valve can efficiently evacuate the air in the pipe to reduce the noise or the interference which causes by air.

Air release valve can only be installed vertically.

Installing air release valve at the highest part of pipe line will recommend.

- ▶ Valve Body Testing Pressure: 32 kgf/cm²
- ▶ Valve Seat Testing Pressure: 25 kgf/cm²
- ▶ Maximum Applied Pressure: 20 kgf/cm²
- ▶ Maximum Applied Temperature: -15°C~80°C
- ▶ Materials of valve body: Ductile Iron, Stainless Steel
- ▶ Applied Conditions: Water
- ▶ With ball valve for manual air release and with check valve
